Prompt Builder Pro: Complete User Guide

What is Prompt Builder Pro?

Prompt Builder Pro is a visual tool for designing reusable, structured AI prompts in JSON format. Instead of writing prompts from scratch every time, you define the objective, role, context, inputs, constraints, and output schema once, then generate consistent JSON configurations that can be used with any AI system.

The tool helps you create prompts that are:

- Structured and repeatable
- Easy to modify and maintain
- Portable across different AI tools
- Quality-controlled with built-in validation

Getting Started

Opening the Application

1. Locate the Prompt Builder Pro HTML file on your computer
2. Open it with any modern web browser (Chrome, Edge, Firefox, Safari)
3. The application runs entirely in your browser - no installation or internet connection required

Understanding the Interface

The application has three main areas:

- **Left Sidebar**: Lists all your saved prompts with buttons to create, export, and import
- **Center/Right Area**: Shows the welcome screen, view screen (for using prompts), or edit screen (for creating/editing prompts)
- **Session Storage Warning**: Prompts are stored temporarily - use Export/Import buttons to save permanently

Creating Your First Prompt

Step 1: Start a New Prompt

1. Click **New Prompt** in the sidebar footer
2. The Edit screen appears with empty fields
3. Work through each section from top to bottom

Step 2: Fill in Prompt Information

Prompt Name (Required)

- Short, memorable identifier
- Examples: "Human Writing Assistant", "Blog Post Outliner", "Code Reviewer"
- Used in the sidebar list to identify your prompt

Description (Recommended)

- One-line explanation of what this prompt does
- Helps you remember the purpose when browsing your prompt library
- Example: "Rewrites text to sound natural and human-like"

Step 3: Define the Seven Components

1. Objective / Task (Required)

Write one clear sentence stating the main job you want the AI to perform.

Examples:

- "Generate natural, human-like prose without AI giveaways"
- "Create detailed blog post outlines for given topics"
- "Review code for bugs, security issues, and best practices"
- "Transform meeting notes into actionable task lists"

Why it matters: This is the most important field - it tells the AI exactly what to do. You cannot save a prompt without it.

2. Actor / Role / Persona (Recommended)

Describe who the AI should pretend to be, including background, expertise, and point of view.

Examples:

- "You are a senior technical writer who creates clear, engaging documentation for software developers"
- "You are an experienced content strategist with 10 years in B2B marketing"
- "You are a helpful coding assistant with expertise in Python and web development"
- "You are a professional editor who specializes in making text concise and impactful"

Why it matters: Gives the AI a perspective and expertise level to work from.

3. Context (Recommended)

Provide background information the AI needs to behave correctly in your domain.

Examples:

- "This is for internal engineering documentation read by backend developers"
- "Our audience is small business owners with limited technical knowledge"
- "We're a SaaS company targeting enterprise clients in healthcare"
- "This content will be published on a public blog focused on personal finance"

Why it matters: Helps the AI understand the audience, domain constraints, and appropriate tone.

4. Input Schema / Fields (Recommended)

Define the structured data the AI will receive when using this prompt.

How to add inputs:

1. Click **Add Input Field**
2. Enter a **Field Name** (e.g., `topic`, `audience`, `tone`, `source_text`)
3. Enter a **Description** explaining what that field represents
4. Add as many inputs as needed
5. Click **Remove** to delete any input field

Example input fields:

Field Name	Description
topic	The main subject to write about
target_audience	Who will read this content
tone	Desired writing style (professional, casual, technical)
word_count	Target length in words

Table 1: Sample input fields for a blog writing prompt

Why it matters: Creates a structured interface for providing information to the AI each time you use the prompt.

5. Constraints / Rules (Recommended)

Define the do's and don'ts that shape style, scope, and behavior.

How to add constraints:

1. Click **Add Constraint**
2. Enter one constraint per text box
3. Add as many as needed
4. Click **Remove** to delete any constraint

Example constraints:

- "Use US English spelling and grammar"
- "Keep sentences under 25 words when possible"
- "Avoid AI-specific phrases like 'delve', 'leverage', 'utilize'"
- "Do not include disclaimers or meta-commentary"
- "Stay under 500 words total"
- "Use active voice, not passive voice"

Why it matters: Ensures consistent quality and style across all outputs.

6. Output Format / Schema (Required)

Define the exact structure of the answer the AI should return.

How to add output properties:

1. Click **Add Output Property**
2. Enter **Property Name** (e.g., title, summary, body, bullets)
3. Enter **Type** (typically string, but can be array, number, etc.)
4. Enter **Description** explaining what this property contains
5. Add as many properties as needed
6. Click **Remove** to delete any property

Example output schema:

Property Name	Type	Description
headline	string	Attention-grabbing title
introduction	string	Opening paragraph (2-3 sentences)
main_points	string	3-5 key takeaways as bullet points
conclusion	string	Closing paragraph with call-to-action

Table 2: Sample output schema for a blog post prompt

Requirements:

- At least one output property with both name and type is required
- You cannot save the prompt without completing at least one output property
- Both name and type must be filled in for each property

Why it matters: Creates predictable, parseable output that can be programmatically processed.

7. Success Evaluation Criteria (Recommended)

Define how you'll judge whether a response is good enough.

How to add criteria:

1. Click **Add Success Criterion**
2. Enter one evaluation standard per text box
3. Add as many as needed
4. Click **Remove** to delete any criterion

Example criteria:

- "User can paste output directly into email without editing"
- "Output requires no fact-checking or verification"
- "Passes Grammarly with no errors"
- "Maintains consistent brand voice throughout"
- "Code compiles and runs without errors"

Why it matters: Sets clear quality standards for evaluating AI responses.

Step 4: Save Your Prompt

1. Click **Save Changes** at the bottom of the Edit screen
2. The application validates your prompt
3. Fix any errors shown in the red panel (required fields)
4. Address warnings shown in the yellow panel (recommended fields) or choose to save anyway
5. After successful save, you'll see a confirmation message
6. The prompt appears in the sidebar list

Understanding Validation

When you click **Save Changes**, the application checks for:

Required Fields (Errors - Must Fix)

- **Prompt name** - Cannot be empty
- **Objective / Task** - Cannot be empty
- **At least one complete output property** - Must have both name and type filled in

If any required field is missing, a red panel appears showing all errors. The related fields are highlighted in red. You must fix these before you can save.

Recommended Fields (Warnings - Can Skip)

- **Description** - Helps identify prompt purpose
- **Actor / Role / Persona** - Improves AI understanding
- **Context or Input fields** - Provides necessary information
- **At least one Constraint or Success criterion** - Defines quality expectations

If recommended fields are missing, a yellow panel shows warnings. You can choose to save anyway by confirming the dialog.

Using a Saved Prompt

Viewing and Filling Inputs

1. Click a prompt name in the sidebar
2. The View screen opens with two panels:
    - **Left panel**: Shows input fields you defined
    - **Right panel**: Shows the generated JSON prompt
3. Type values into the input field boxes
4. The JSON on the right updates automatically as you type

Understanding the Generated JSON

The JSON output includes:

- `objective` - Your defined task
- `actor` - The role/persona you specified
- `context` - Background information you provided
- `input` - Object containing your input field values

- `constraints` - Array of rules you defined
- `outputschema` - Structured definition with:
  - `type`: "object"
  - `properties`: Each output property with type and description
  - `required`: Array of all output property names
- `successcriteria` - Array of evaluation standards
- `outputinstructions` - Automatic instruction telling the AI to return only the specified properties without extra prose

Copying or Downloading the JSON

Copy to Clipboard:

1. Click the **Copy** button below the JSON
2. Paste into your AI tool, API call, or workflow automation

Download as File:

1. Click the **Download** button below the JSON
2. A file named `prompt.json` downloads to your computer
3. Use this file in automated systems or share with team members

Managing Your Prompts

Editing an Existing Prompt

From the sidebar:

1. Find the prompt in the list
2. Click the **Edit** button next to the prompt name
3. Make your changes in the Edit screen
4. Click **Save Changes** when done

From the View screen:

1. Click **Edit Prompt** button in the left panel
2. Make your changes
3. Click **Save Changes** when done

Deleting a Prompt

1. Find the prompt in the sidebar list
2. Click the **Delete** button next to the prompt name
3. Confirm deletion in the dialog
4. The prompt is permanently removed

Warning: Deleted prompts cannot be recovered unless you have an exported backup.

Exporting and Importing Prompts

Why Export?

Prompts are stored in your browser's memory only. This means:

- Closing the browser window keeps prompts (they persist in session storage)
- Clearing browser data or cache **deletes all prompts**
- You cannot access prompts from a different browser or computer

Best practice: Export your prompts regularly to create permanent backups.

Exporting All Prompts

1. Click **Export Prompts** in the sidebar footer
2. The application attempts to download a `.json` file containing all your prompts
3. If download succeeds, save the file to a safe location
4. If download fails (browser restrictions):
    - A modal window shows the JSON data
    - Click **Copy to Clipboard**
    - Paste into a text editor
    - Save as a `.json` file (e.g., `my-prompts-2026-02-02.json`)

Importing Prompts

1. Click **Import Prompts** in the sidebar footer
2. Choose a previously exported `.json` file
3. If you have existing prompts, confirm replacement (this action replaces all current prompts)
4. The application loads all prompts from the file
5. A success message shows how many prompts were imported

Warning: Import replaces all current prompts. Export your current prompts first if you want to keep them.

Complete Workflow Example

Let's create a practical prompt for generating blog post outlines.

Step 1: Create New Prompt

Click **New Prompt** in the sidebar.

Step 2: Fill Basic Information

- **Name**: Blog Post Outliner
- **Description**: Creates detailed, SEO-friendly blog post outlines for content writers

Step 3: Define Components

Objective:
Generate detailed blog post outlines with clear structure, SEO considerations, and actionable section briefs.

Actor:
You are a senior content strategist with 12 years of experience in B2B SaaS marketing. You specialize in creating high-performing blog content that ranks well in search engines and drives conversions.

Context:
Our company sells project management software to mid-size tech companies. Our blog targets product managers, team leads, and operations directors who are researching productivity solutions. We prioritize practical, actionable content over theory.

Input Fields:

Field Name	Description
topic	The main subject or keyword to write about
target_audience	Primary reader persona (job title/role)
content_goal	What action readers should take after reading
word_count_target	Desired article length (e.g., 1500-2000 words)

Constraints:

- Include 5-7 main sections minimum
- Each section should have 2-4 supporting bullet points
- Use clear, benefit-driven headings (not generic titles)
- Avoid jargon unless it's industry-standard terminology
- Include at least one data-driven section or case study hook
- Suggest one compelling statistic or quote for the introduction

Output Properties:

Property Name	Type	Description
working_title	string	SEO-optimized headline (60-70 characters)
meta_description	string	Search engine description (150-160 characters)
introduction_angle	string	Hook and context for opening (2-3 sentences)
main_sections	string	Numbered list of sections with bullet points
conclusion_cta	string	Closing summary and call-to-action
seo_keywords	string	5-8 target keywords to naturally incorporate

Success Criteria:

- Content writer can start drafting immediately without additional research
- Outline covers topic comprehensively with logical flow
- Headings and structure support SEO best practices
- Each section has clear value proposition for the reader

Step 4: Save and Use

1. Click **Save Changes**
2. Address any validation warnings
3. Click the prompt in the sidebar to open View screen
4. Fill in inputs:
    - **topic**: "How to run effective retrospectives"
    - **target_audience**: "Engineering team leads and scrum masters"
    - **content_goal**: "Download our retrospective template"
    - **word_count_target**: "1800-2000 words"
5. Click **Copy** to grab the JSON
6. Paste into your AI tool (ChatGPT, Claude, API, etc.)
7. The AI generates a structured outline matching your specifications

Tips for Creating Effective Prompts

Be Specific in the Objective

- ✕ "Write content"
- ✓ "Transform technical documentation into beginner-friendly tutorials"

Give the Actor Concrete Expertise

- ✕ "You are helpful"
- ✓ "You are a cybersecurity expert with CISSP certification who explains complex threats to non-technical executives"

Make Constraints Measurable

- ✗ "Keep it short"
- ✓ "Maximum 300 words total"

Design Output Schema for Parsing

- Use consistent property names across related prompts
- Choose types that match how you'll process the data
- Provide clear descriptions for each property

Test and Iterate

1. Create a prompt with your best guess at components
2. Use it with real inputs
3. Note where the AI output misses the mark
4. Edit the prompt to add constraints or clarify the objective
5. Test again until output quality is consistent

Common Use Cases

Content Creation

- Blog post writers and editors
- Social media caption generators
- Email campaign drafters
- Product description writers

Development and Technical

- Code reviewers and debugging assistants
- Documentation generators
- API response formatters
- Test case creators

Business Operations

- Meeting summarizers
- Report generators
- Data analyzers with structured output
- Customer feedback processors

Education and Training

- Lesson plan creators
- Quiz and assessment generators
- Study guide builders
- Feedback and grading assistants

Troubleshooting

"Validation errors prevent saving"

Problem: Red panel shows required fields missing.

Solution:

1. Check that Prompt Name is filled in
2. Verify Objective/Task has content
3. Ensure at least one output property has both name and type
4. Look for fields highlighted in red and complete them

"Downloaded JSON file won't open"

Problem: Double-clicking the `.json` file doesn't work.

Solution:

- Don't try to open it directly
- Copy the contents and paste into your AI tool
- Or open with a text editor (Notepad, TextEdit, VS Code) to view contents

"Export button doesn't download"

Problem: Browser security restrictions prevent automatic download.

Solution:

1. Look for the modal window that appears
2. The JSON data is displayed in a text area
3. Click **Copy to Clipboard**
4. Paste into a text editor
5. Save manually as `prompts.json`

"Lost all my prompts"

Problem: Cleared browser data or cache.

Solution:

- Prompts stored in session storage are gone
- Restore from your most recent export file
- Use Import Prompts to load the backup
- Going forward, export regularly (daily or weekly)

"Import replaces all prompts"

Problem: Accidentally overwrote current prompts.

Solution:

- Export current prompts **before** importing
- Keep multiple dated export files

- Merge prompts manually by editing the JSON files in a text editor

Best Practices

Organization

- Use clear, consistent naming conventions
- Group related prompts with prefixes (e.g., "Blog - Outliner", "Blog - Rewriter")
- Export and name files with dates (e.g., `prompts-2026-02-02.json`)
- Keep a master export file and project-specific exports

Maintenance

- Review and update prompts quarterly
- Test prompts periodically to ensure quality hasn't degraded
- Document successful prompts in a separate guide
- Share working prompts with team members via export files

Version Control

- Export after every significant change to a prompt
- Keep old versions with date stamps
- Note what changed in file names (e.g., `blog-outliner-v2-added-seo.json`)

Collaboration

- Export prompts and share via email or shared drive
- Team members import to add to their library
- Establish naming standards across the team
- Create a central repository of approved prompts

Advanced Tips

Reusing Components Across Prompts

Many prompts share similar actors or constraints. Consider:

- Keeping a text file of standard actors, contexts, and constraints
- Copy-pasting these into new prompts for consistency
- Exporting individual prompts as templates

Creating Prompt Families

Build related prompts that work together:

- "Blog - Outliner" creates the structure
- "Blog - Drafter" writes from the outline
- "Blog - Editor" refines the draft
- "Blog - SEO Optimizer" adds keywords and meta

Combining with AI Workflows

- Copy JSON prompts into automation tools (Make, Zapier)
- Use output schemas that match your database structure
- Chain multiple prompts together programmatically
- Store prompts in version control (Git) for team access

Testing Variations

- Duplicate a prompt and modify one component
- Test both versions with identical inputs
- Compare output quality to find what works best
- Delete the less effective version

Keyboard Shortcuts and Speed Tips

- Use **Tab** to move between fields quickly
- Use **Shift**+**Tab** to move backward through fields
- Press **Enter** in text inputs to move to next field
- **Ctrl**+**A** (Windows) or **Cmd**+**A** (Mac) to select all in a text area
- Click prompt names (not Edit button) for quick view access

Summary

Prompt Builder Pro transforms ad-hoc AI prompting into a structured, repeatable process. By defining the seven components (Objective, Actor, Context, Inputs, Constraints, Output Schema, Success Criteria), you create reusable prompt templates that deliver consistent, high-quality results.

The key workflow is:

1. **Create** structured prompts using the builder
2. **Save** and validate your prompts
3. **Use** prompts by filling input fields
4. **Copy** generated JSON to your AI tool
5. **Export** regularly to preserve your work

With practice, you'll build a library of specialized prompts that dramatically improve your AI workflow efficiency and output quality.
